CITATION: Ahannaya, C.G., Olalere, M.D., Oyetola, O., Olufolake, M.S. & Adesina, B.H. (2025). Artificial intelligence and institutional goal actualization of professional accounting Institutes in Nigeria, *Journal of Global Accounting*, 11(1), 1 - 28. Available: <https://journals.unizik.edu.ng/joga>

ABSTRACT

Goal actualization facilitates accounting institutes' ability to meet the needs of present customers while taking into account the needs of future generations. Goal actualization remains a growing field of research in varied organizations in light of the need to achieve and sustain competitive advantage through core competence. The research design adopted was a cross-sectional survey. The survey was conducted among 90,950 active professional members of the Institute of Chartered Accountants of Nigeria (ICAN) and the Association of National Accountants of Nigeria (ANAN). The sample size of 520 was determined using Taro Yamane formula. The findings showed that Artificial Intelligence had a positive and significant effect on institutional goal actualization with ($R^2 = 0.612$, $\chi^2_{(5)} = 298.944$, $p < 0.05$), of professional accounting institutes in Nigeria. The study concluded that Artificial Intelligence affected institutional goal actualization of professional accounting institutes in Nigeria. It was recommended that professional accounting institutes should create more public education on the advantages and disadvantages of adopting Artificial Intelligence with a view to positioning stakeholders for seamless adoption of the technology.

Key words: Accounting Institutes, Artificial Intelligence, Institutional corporate social responsibility, Institutional goals actualization, Institution Sustainability.

1. INTRODUCTION

Accounting professional institutes have the objectives of achieving and maximizing institutional sustainability in terms of institutional growth, efficiency, corporate social responsibility, stakeholder loyalty, wealth and value creation of the institutes. Attaining the goal of achieving these objectives depends on the management ability to institutionalized disruptive technology via artificial intelligence, robotic technology, cloud accounting, block chain technology, and quick book technology. However, achieving accounting institutional sustainability requires proactiveness and need to navigate the dynamic forces of economic

and technological changes. These economic and technology changes, from technological revolution to rising environmental and social concerns, from seismic demographic shifts to mass geopolitical change, and from global systemic economic shocks to regulatory developments create challenges and difficulties for accounting professional institutes to achieve sustainability (Sorina-Geanina, Adriana & Ana-Maria, 2018). Among accounting professional institutions in developed countries, Siegel (2020) stated that advance information technology in accounting (artificial intelligence) have been recognized, used and depended upon in the developed countries within accounting professional institutes. Unlike, developing economies like Nigeria, Ghana, Kenya among other Africa developing economies; where Siegel (2020) stated that accounting professional institutes and accounting professionals have not adopted and fully recognize accounting technological advancement such as artificial intelligence, robotic technology, cloud accounting, block chain technology, and quick book technology in the day to day accounting functions in their endeavour.

Institutional sustainability remains a growing field of research in varied organizations in light of the need to achieve and sustain competitive advantage through core competence. However, conceptual observation has shown that most organizations especially accounting institutions in developing countries such as, Nigeria among others have not been able to achieve sustainability with consistent reports of either close-shop and or mergers of financial institutions, leading to lose in several millions/billions of naira. This scrutiny is evident in the artificial intelligence, robotic technology, cloud accounting, block chain technology, and quick book technology in these countries (Shonubi, 2024). Several studies have been conducted on disruptive technology and institutional goals actualization in developed countries and limited studies in developing countries however, the results have been inconclusive. A study by Zhang, Dai, and Vasarhelyi (2018) found that disruptive technologies have not significantly influenced accounting and auditing students in the universities. Conversely, Kruskopf, Lobbas, Meinander, Söderling, Martikainen and Lehner (2019) found disruptive technology has positive influence on all aspects of companies in the world. More so, the most rapid changes in current times are coming from the development and implementation of artificial intelligence, robotic process automation, and other groundbreaking technologies such as cloud accounting, block chain technology, and quick book technology (Jędrzejka, 2019). The implication of this is that studies have shown that there is a relationship between artificial intelligence and goal actualization of professional accountants and accounting institutes. This is in line with the findings from a study by Seseni

and Mbohwa (2018) that a positive relationship exists between artificial intelligence and goal actualization of professional accounting institutes. Similarly, Shaban and Ali (2014) had earlier postulated that the main driving force behind cloud computing as a dimension of disruptive technology include wireless networks, reducing storage costs and improving the software for online processing to achieve organisation goals.

Professional accounting institutes in Nigeria aim to achieve and maximize institutional sustainability through growth, efficiency, corporate social responsibility, stakeholder loyalty, and wealth creation. However, these institutes have ranked low in the World Economic Forum's rankings due to poor adoption of disruptive technology such as artificial intelligence, robotic technology, and cloud accounting. This has reduced their sustainability in terms of growth, survival, continuity, efficiency, and corporate social responsibility compared to developed countries. The challenge of adopting disruptive technology measures among accounting professional teaching institutes and scholars in developing countries like Nigeria has led to inadequate teaching of these technologies, creating poor institutional goals actualization, decline in growth, survival, continuity, institutional inefficiency, and enhancing competitive disadvantage. The impact of globalization on the accountancy profession has also affected Nigerian institutes, with some still using manual filing systems, analog computers, and few branches nationwide.

Limited studies have been conducted to assess the impact of artificial intelligence (AI) on sustainable development, including the Sustainable Development Goals (SDGs) and 169 targets internationally agreed in the 2030 Agenda for Sustainable Development. Low skill quality in accounting technologies has resulted in a lack of sustainability among Nigerian institutes. Failure to adopt and adapt to disruptive technologies key drivers has created institutional inefficiency among accounting practitioners and institutes in Nigeria. Dominic and Wilhelmina (2012) stated that accounting professional institutes may not achieve targeted goals, stakeholder loyalty, growth and survival, efficiency in accounting service delivery, and institutional corporate social responsibility due to their lack of in-depth knowledge of disruptive technologies.

1.2 Objective

The study intends to determine the effect of artificial intelligence on institutional goals actualization of professional accounting institutes in Nigeria

1.3 Hypothesis

H₀₁: disruptive technology has no significant effect on institutional goals actualization of professional accounting institutes in Nigeria

2. LITERATURE REVIEW

2.1 Conceptual Review

2.1.1 Institutional Goals Actualization

Goals are an essential part of establishing priorities and setting an organisation up for success over a set period of time. According to Okunbanjo (2020), organisational goals are goals that a business anticipates accomplishing in a set period of time. It typically represents an organisation's larger purpose and work to establish an end-goal for employees to work towards. Business goals define the "what" of a business's purpose whereas business objectives define the "how." Business goals typically only provide a general direction that a company will follow whereas business objectives clearly outline actionable steps. Okunbanjo (2020) further stated that organizational goals are outcome statements that define what an organization is trying to accomplish, both programmatically and organizationally. Goals are usually a collection of related programs, a reflection of major actions of the organization, and provide rallying points for managers. Given the importance of goal-setting for predicting organizational behaviors and outcomes, it is essential to develop a more detailed and comprehensive understanding of the factors affecting firms' decisions to pursue a specific set of goals (Kotlar, De Massis, Wright, & Frattini, 2018).

At the organizational level, several factors influence organizational goals such as firm age and size (Short & Palmer 2003) and firm resources (Audia & Greve 2006). Organizations that differ in terms of industrial sector, size, ownership type, governance or market position, among other characteristics, pursue diverse organizational goals (Kotlar *et al.*, 2018). Ibietan (2017) posited that goal actualization occurs when an organisation accomplish its long term vision. The goal expresses a fundamental objective that represents a desire that is an end in itself with respect to the situation at hand (Bond, 2008). Goals actualization are aspirational,

that is to say they are not statements about what an organisation is but rather what it wants to become.

2.1.2 Artificial Intelligence

Artificial intelligence (AI) is a broad concept, and there are many different views on what intelligent machines are capable of accomplishing. Odoh, Echefu, Ugwuanyi, and Chukwuani (2018) defined artificial intelligence as the application of computational tools to address tasks traditionally requiring human sophistication. Artificial Intelligence is defined as the human intelligence being used by a computer system (Seseni & Mbohwa, 2019). Deloitte (2017) sees artificial intelligence as the name of the academic field of study which studies how to create computers and computer software that are capable of intelligent behavior. Elaine (2017) sees artificial intelligence as the study of how to make computers do things better than human. According to Odoh *et al* (2018), artificial intelligence is a system that thinks like humans (system that thinks rationally) and systems that act like humans. Artificial intelligence is seen as the capability of a device to perform activities which would otherwise only be expected of the human brain (Muhammad & Gang, 2019). These activities include the capacity for knowledge and the ability to acquire it. It also comprises of the ability to judge, understand relationships and produce original thoughts. Artificial intelligence aims to make an intelligent machine that can react in ways similar to human. It is thus seen as the simulation of the human brain.

According to Muhammad and Gang (2019), artificial intelligence is enhanced by major technologies which include expert system, Neural network, Fuzzy Logic, Genetic algorithm, Natural Language Processing (NLP) and intelligence agent. Expert Systems: Expert systems are artificial intelligence programs adopted in the 1980's that reach a level of expertise capable of replacing human specialty in a particular field of decision making. Expert systems are easily implemented and most widely used artificial intelligence technology (Shahid & Li, 2019). They include computer programs that simulate the thinking manner of expert in a particular field. They are often developed with expert system shells. An Expert system shell is a software programming environment which enables the construction of expert or knowledge based systems. According to Taghizadeh, Mohammad, Dariush, and Jafar (2013) expert system software can be developed for any problem that involves a selection from among a definable group of choices where the decision is based on logical steps. Hence any

area where a person/group has special expertise needed by others is a possible area for an expert system (Muhammad & Gang, 2019).

2.2 Theoretical Review

This section of the review provides the basic theoretical assumptions for this study. It will focus on relevant theories that can be applied to the variables and concepts in order to come up with a logical linkage between the variables. These theories are Christensen Theory of Disruption Technology, model of organisation, diffusion innovation theory, resource based view theory and technology acceptance model.

2.2.1 Christensen Theory of Disruption Technology

The Christensen Theory of Disruption Technology, introduced by Clayton Christensen in 1997, posits that through disruptive technology and innovation processes, institutions can maintain continuity and compete with larger multinational companies worldwide. The theory focuses on new and ground-breaking technologies that impact a firm's existence, while Chishakwe and Smith (2012) support the idea that disruption technology and innovation are a function of firm continuous performance and sustainability in the face of global competition. However, the theory's asymmetric assumptions, such as treating incumbent firms as heterogeneous actors with different preferences, incentives, and competencies, and not recognizing the influence of the environment, have led to a lack of managerial solutions.

Christensen differentiates between sustainable technologies and disruptive technologies, with sustainable technologies adding value to existing products and disruptive technologies disrupting performance levels and creating new marketplaces. Technological improvements in disruptive technology often result in performance improvements of established products, making them simpler and more appealing to customers. As competition increases, firms strive to upgrade their performance levels, but these improvements may increase faster than anticipated customer needs, leading to disruptive technologies.

2.2.2 Diffusion Innovation Theory

The diffusion innovations theory, developed by Everett Rogers in 1976, explains how and at what rate new ideas and technology spread. It is based on the adopters-based theory developed by Surry and Farquhar (1997), which outlines five stages of diffusion: knowledge, persuasion, decision, implementation, and confirmation. The theory focuses on the conditions that

increase or decrease the likelihood of a new idea, product, or practice being adopted by members of a given culture. It also considers attributes associated with technological innovations that influence the rate of adoption. Diffusion of innovation theory emphasizes the importance of disruptive technology in identifying and exploiting scientific and technological opportunities, exerting a significant influence on innovation ability and providing a competitive advantage. The diffusion model consists of three main elements: identification of diffusion stages, characteristics of innovation that impact the rate of diffusion, and the adopter's strategy. In the competitive environment, innovation is considered a firm's core value creation capacity and a crucial competitive weapon. Therefore, accounting institutes in Nigeria should follow these stages of diffusion theory to adopt disruptive technology for a competitive advantage in the global society.

2.2.4 Technology Acceptance Model

The Technology Acceptance Model (TAM) is a popular research model developed by Davis in 1989 to predict the use and acceptance of information systems and technology by individual users. It focuses on two factors: perceived usefulness and perceived ease of use. Perceived usefulness is the prospective user's subjective probability that using a specific application system will enhance their job or life performance, while perceived ease of use is the degree to which the user expects the target system to be free of effort.

The TAM model is influenced by external variables such as social, cultural, and political factors. Social factors include language, skills, and facilitating conditions, while political factors involve the impact of technology use in politics and political crises. The attitude to use evaluates the desirability of employing a particular information system application, while behavioral intention measures the likelihood of a person employing the application. However, TAM has faced criticism for its questionable heuristic value, limited explanatory and predictive power, triviality, and lack of practical value. It has also been criticized for diverting researchers' attention away from other important research issues and creating an illusion of progress in knowledge accumulation. The TAM framework often overlooks other issues, such as cost and structural imperatives that force users into adopting technology.

2.3 Empirical Review

Ali, Omar and Bakar (2016) investigated the effect of accounting information system (AIS) on organizational performance in Jordanian banking sector. The study used four types of AIS success factors as the determinants performance namely service quality; information quality, data quality and system quality. Data were collected with a structured questionnaire survey and analyzed with PLS SEM technique. The findings revealed that service quality, information quality and system quality are the significant AIS success factors for increasing organizational performance. Shaban and Ali (2014) investigated effect of cloud computing in accounting and comparison with the traditional model. The study explored the concept of cloud accounting in terms of characteristics, advantages as well as disadvantages viz-a-viz traditional model. The study concluded that the main driving force behind cloud computing are Include wireless networks, reducing storage costs.

Sobhan (2019) explored the concept of cloud accounting and its adoption in Bangladesh. The study stated that there are three models of cloud accounting namely IaaS (Infrastructure as-a-Service), PaaS (Platform as-a-Service) and SaaS (Software as-a-Service). Cloud accounting is more cost effective, secure and flexible and, provides larger storage compared to traditional accounting. Mirrazavi and Khoorasgani (2016) evaluated the impact of cloud computing technology on organizational performance; financial, customer, and operational. The t-test statistics results showed that cloud computing technology has a positive and significant impact on the organizational performance. Also, cloud computing has a positive and significant impact on the dimensions of organizational performance- financial, customer and operational.

Seseni and Mbohwa (2018) examined the implications of artificial intelligence (AI) on Soweto furniture manufacturing SMEs. The study adopted qualitative research approach and case study research design. The study discovered that SMEs in the studied area are not ready because they do not have the necessary resources to can operate AI despite the fact that it could improve the quality of products and services. The study further positioned that the implementation of artificial intelligence will mean that most people will lose their jobs due to their jobs being replaced by a computer system. Shahid and Li (2019) examined the impact of artificial intelligence among marketing professionals of Pakista. Qualitative research method which involved semi-structured interviews with different marketing professional belonging from different firms of Pakistan was utilized conducted. The study concluded that

integration of AI in the marketing functions will improve the performance of the business and thus, achieving profitability and competitive advantage.

Lichtenthaler (2019) explored intelligence-based view of firm performance and artificial intelligence and established that an intelligence-based perspective underscores the need to integrate AI applications with specific human expertise to complicate imitation by competitors. The study concluded that firms further need to develop a meta-intelligence to dynamically renew and recombine their intelligence architecture with multiple types of human and artificial intelligence in order to attain competitive advantage. Choi, Kim and Park (2018) conducted an empirical study on process innovation and robotic technology among small and medium-sized enterprises. The study adopted stratified sampling technique and primary data through the use of questionnaire. The results of the structural equation model indicated that there is significant influence of robotic technology on process innovation. Quinn and Cleary (2016) conducted an exploratory study on intellectual capital and business performance using cloud accounting as a moderator. The study adopted survey research design and collected through questionnaire. The regression results revealed that cloud accounting have a positive and statistically significant impact on human capital and relational capital. However, an insignificant effect was found on structural capital.

3. MATERIALS AND METHOD

The study adopted cross-sectional survey research design, which was a valuable design for assessing opinion, people's beliefs, motivations, and behavioral patterns at a particular time and facilitate the use of a questionnaire research instrument in obtaining data for the analysis (Zikmund, Quinlan, Babbitt, Carr, & Griffin, 2015). The population of this study covered the professional members of the major accounting professional institutes operating in Nigeria which are mainly: - Institute of Chartered Accountant of Nigeria (ICAN), The Association of National Accountants of Nigeria (ANAN), Institute of Certified Public Accountant of Nigeria (ICPAN), Chartered Institute of Management and Cost Accountant (CIMCA), and Association of Chartered Certified Accountant (ACCA).

Table 1: Population of Professional Accounting Institutes in Nigeria

S/N	Professional Accounting Institutes	Number of Professional members	Year of Establishment
1	ICAN	52,250	1st September, 1965
2	ANAN	38,700	1st January, 1979
	Total	90,950	

Source: Website of Various Accounting Professional Institutions (2021)

The selection of a set of people or group to participate in the study investigation could be described as a study sample. Sampling size according to Kotler and Keller (2012) is the list of individuals in a population from which a sample is drawn from. To obtain the representative sample size for this study the Taro Yamani formula (1997) of sample size was applied. And the researcher, judgmentally added 30% for non-respondents.

The following formula applies:

$$n = \left(\frac{N}{1 + N(e)^2} \right)$$

n = the sample size

N = the population size

e = 95% confidence interval.

$$= \frac{90950}{1 + 90950(0.05)^2}$$

$$n = \frac{90950}{90951 \times 0.0025}$$

$$n = 400$$

$$n = \frac{90950}{90951 \times 0.0025}$$

$$n = 400$$

With a 30% addition to make up for non-respondent of 400 = 120

the sample size becomes 520.

$$\text{ICAN} = \frac{52,250}{90,950} \times \frac{520}{1}$$

$$= 299$$

$$\text{AWAN} = \frac{38,700}{90,950} \times \frac{520}{1}$$

$$= 221$$

$$\text{Total} = 299 + 221$$

$$= 520$$

In view of the research design for this study and after assessing various research objectives, questions and hypotheses, primary source of data was used in gathering data from the respondents. The primary data was collected through administering copies of questionnaire to the target respondents. The justification for using questionnaire was due to the fact that, the questionnaire translated research objectives into specific questions which the respondents were asked to answer. To achieve the objectives of this study, primary data were collected and the primary data were analyzed using both descriptive and structural equation modeling techniques.

4. RESULT AND DISCUSSIONS

4.1 Descriptive Statistics

The summary statistics of both the socio-demographic variables and variables used for inferential statistics are presented in the section below. The variables of the analysis are analyzed using different tools of descriptive statistics such as frequency and percentage distribution for socio-demographic variables. Also, the inferential variables used both frequency distribution, percentage distribution, weighted mean score, standard deviation, and ranking. Meanwhile, the summary statistics such as mean, standard deviation, minimum, maximum, and total number of observations are presented in the analysis of the independent and the dependent variables.

The target number of questionnaires expected to be filled by ICAN and ANAN professionals in accounting was 520 copies. Responses from the questionnaire were drawn from various parts of Nigeria and foreigners since Nationality is divided into two main aspects. Due to missing copies of questionnaire, incomplete cases and data access challenges, 496 copies of the questionnaire were filled completely and correctly. As shown in Table 2, 95.4% of the questionnaire were adequate for data analysis and made an inference on Nigeria.

Table 2: Response Retrieved

Questionnaire	Total Administered	Total Retrieved	%
ICAN	299	284	54.61
ANAN	221	212	40.75
Total	520	496	95.46

Source: Researcher's Field Survey, (2024)

This section discusses the background information of the people who responded to disruptive technology and institutional sustainability of professional accounting institutes in Nigeria and the variables used in the section are analyzed accordingly. The socio-demographic variables of the respondents include gender, age, marital status, highest educational level, professional qualification, current management level, current function, and length of service.

4.1.1 Gender

The gender of an individual is an important aspect of this data analysis as it presents information about the individual and helps to know the opinion of both male and female on the artificial intelligence and institutional sustainability of professional accounting institutes. The gender is sub-divided into male and female categories and analyzed using frequency and percentage distribution as indicated in Table 3

Table 3: Gender of the Respondents

Gender	Frequency Distribution	Percentage Distribution
<i>Male</i>	257	51.8
<i>Female</i>	239	48.2
Total	496	100.0

Source: Researcher's Field Survey, 2024

Table 3 shows the number of people who responded to male and female and the result is presented above. From the result, it could be deduced that the majority of the respondents who responded to the question are male with the frequency and percentage distribution of 257 (51.8 percent) while 239 (48.2 percent) are female.

4.1.2 Age of the Respondents

Different categories of age-group are determined in this section as indicated in Table 4. The age group considered is from 18 years and above since it is believed that 18 years of age people are employed have more knowledge on disruptive technology and institutional sustainability. The categories of the age group include 18 – 28 years; 29 – 39 years; 40 – 49 years, and 50 years and above analyzed using frequency and percentage distribution as explained below.

Table 4: Age of the Respondents

Age	Frequency Distribution	Percentage % Distribution
18 – 28 years	74	14.9
29 – 39 years	221	44.6
40 – 49 years	144	29.0
• 50 years	57	11.5
Total	496	100.0

Source: Researcher's Field Survey, 2024

From Table 4, it is shown that the majority of the respondents are between the age group of 29 – 39 years with the frequency and percentage distribution of 221 (44.6 percent); followed by 144 (29.0 percent) of the respondents whose ages are between 40 – 49 years; 74 (14.9 percent) are 18 – 28 years, and 57 (11.5 percent) are greater than 50 years.

4.1.3 Marital Status of the Respondents

Information gathered on the marital status of the respondents is analyzed using frequency and percentage distribution as described in Table 5. The marital status consists of single, married, and divorced, separated, widowed, and widower is classified as marital status.

Table 5: Marital Status of the Respondents

Marital Status	Frequency Distribution	Percentage % Distribution
Single	179	36.1
Married	279	56.2
Others	38	7.7
Total	496	100.0

Source: Researcher's Field Survey, 2024

From the result, Table 5 shows that the majority of the respondents are married with the frequency and percentage distribution of 279 (56.2 percent) out of the total respondents of 496; followed by 179 (36.1 percent) which are single, and only 38 (7.7 percent) belong to other categories of marital status.

4.1.4 Nationality

In an organization, it is believed that different nationalities can be found in the organization as this section is classified into Nigerian and foreigner. Foreigners in this section are people who work in Nigeria but are not Nigerian citizens or a person coming from countries other

than Nigeria. Also, Asbrock, Lemmer, Becker, Koller, and Wagner, (2014) defined Foreigners, known as Immigrants as no homogeneous group. The section is analyzed using frequency and percentage distribution as displayed in Table 6.

Table 6: Nationality of the Respondents

Nationality	Frequency Distribution	Percentage % Distribution
Nigerian	449	90.5
Foreigner	47	9.5
Total	496	100.0

Source: Researcher's Field Survey, 2024

Most of the people interviewed on disruptive technology and institutional sustainability are Nigerians showing the frequency and percentage distribution of 449 (90.5 percent) while only 47 (9.5 percent) are Foreigners. This shows that the majority of the people interviewed and people who responded to the questionnaires are Nigerians. More Nigerians are found in the organization where the questionnaires were distributed because it is not easy for people to migrate from their countries and work in another country.

4.1.5 Highest Educational Level

Education is one of the most important factors to be determined on the disruptive technology and institutional sustainability of professional accounting and it is analyzed using frequency and percentage distribution.

Table 7: Highest Educational Level of the Respondents

Educational Level	Frequency Distribution	Percentage % Distribution
WASC/OND	37	7.5
BA/BSC/HND	213	42.9
MA/MSC/MPHIL	135	27.2
PHD	111	22.4
Total	496	100.0

Source: Researcher's Field Survey, 2024

It is important to know how educated the respondents are. The influence of technology in education can shape the lives of people, especially organizations. This helps people to shape their level of education and offers are given to people who have opportunities who take part in innovation and technological advancement. More so the level of education of people seems

to have an impact on technological advancement and making them more globalized. From the result, it is observed that the majority of the people who responded are HND/BA/BSc holders with the frequency and percentage distribution of 213 (42.9 percent); followed by the respondent having MA/MSc/MPhil certificate with the frequency and percentage distribution of 135 (27.2 percent); 111 (22.4 percent) are Ph.D. holders, and only 37 (7.5 percent) are having WASC/OND certificate out of the total respondents of 496. This has proven that education is crucial in determining the disruptive technology and institutional sustainability of professional accounting institute.

4.1.6 Professional Qualification of the Respondents

The most recognized professional qualification for accountants is the two mentioned below. It is believed that the respondents are expected to be part of either ICAN/ACCA or ANAN professional qualification for accountants. This section investigates the type of professional qualification the respondents belong to using a structured form of a questionnaire which is analyzed using frequency and percentage distribution.

Table 8: Professional Qualification of the Respondents

Qualification	Frequency Distribution	Percentage % Distribution
ICAN/ACCA	284	58.1
ANAN	212	33.1
Total	496	100.0

Source: Researcher's Field Survey, 2024

The top professional qualification identified by the respondents is ICAN/ACCA showing the frequency and percentage distribution of 284 (58.1 percent) while 212 (33.1 percent) out of 496 belong to ANAN professional qualification for accountants. It is observed that ICAN/ACCA is the most recognized professional qualification for accountants out of the two presented in the study and people who are interviewed belong to the most recognized professional qualification for accountants. ICAN/ACCA holders are people who work as an auditor, accountant, finance analysis, etc. since the professional accountants provide an offer to business-relevant, first-choice qualification to people who applied, seek the ability and ambition around the world for people who seek their career in accountancy, management, and finance. The other professional qualification for an accountant is also recognized but not like that of ICAN/ACCA professional qualification for accountants.

4.1.7 Current Management Level of the Respondents

Most organizations have three levels of management as top, middle, and lower level. This section also incorporates the three-level of management and it is analyzed using frequency and percentage distribution.

Table 9: Current Management Level

Management Level	Frequency Distribution	Percentage % Distribution
Top	150	30.2
Middle	275	55.4
Others	71	14.3
Total	496	100.0

Source: Researcher's Field Survey, 2024

Most of the people interviewed are middle managers, also known as middle-level managers showing 275 (55.4 percent) as their frequency and percentage distribution while 150 (30.2 percent) are top-level managers, and others regarded as the first level managers show the frequency and percentage distribution of 71 (14.3 percent). This indicates that the majority of the people who responded to the questionnaires are middle-level managers.

4.1.8 Current Function

The function of each of the respondents in the organization is examined using frequency and percentage distribution. This helps to know the number of people who are president, head of finance, head of planning, and others.

Table 10: Current Function

Function	Frequency Distribution	Percentage % Distribution
President	34	6.9
Head, Finance	217	43.8
Head, Planning	140	28.2
Others	105	21.2
Total	496	100.0

Source: Researcher's Field Survey, 2024

It is deduced that most of the people interviewed are from the head, finance since it has the highest frequency and percentage distribution of 217 (43.8 percent) out of the total respondents of 496; followed by the respondents from head planning showing the frequency

and percentage distribution of 140 (28.2 percent), 105 (21.2 percent) belong to other current functions, and only 34 (6.9 percent) of the respondents are president. This proves that the majority of the people who responded to the questionnaires have their current functions as head, finance.

4.1.9 Length in Service

The duration in which the respondents have stayed in service is categorized in the table below. The duration is expressed in five (5) years intervals and it is analyzed using the frequency and percentage distribution.

Table 11: Length in Service

Service	Frequency Distribution	Percentage % Distribution
0 – 5 years	101	20.4
6 – 10 years	128	25.2
11 – 15 years	120	24.2
16 – 20 years	93	18.8
21 – 25 years	23	4.6
26 – 30 years	17	3.4
➤ 31 years	14	2.8
Total	496	100.0

Source: Researcher's Field Survey, 2024

Table 11 shows that 128 (25.2 percent) of the respondents have used 6 - 10 years in service; followed by 120 (24.2 percent) who have used 11 - 15 years in service; 105 (20.4 percent) used 0 - 5 years in service; 93 (18.8 percent) used 16 - 20 years in service; 23 (4.6 percent) used 21 - 25 years in service; 17 (3.4 percent) used 26 - 30 years in service, and 14 (2.8 percent) have used more than 31 years in service. This implies that a larger percentage of the people interviewed have used 6 - 10 years and they have 6 - 10 years of working experience while the least people interviewed are their working experience for 31 years and above.

4.1.10 Artificial Intelligence

In this section, the measurement of variables used in artificial intelligence is the ordinal level of measurement, also known as the Likert Scale. The variables range from not at all to a very large extent which is on a scale of 1 – 6.

Table 12 Descriptive Analysis of Artificial Intelligence

		Frequency and Percentage Distribution						Weighted Mean Score	
Artificial Intelligence		NA (%)	VSE (%)	SE (%)	ME (%)	LE (%)	VLE (%)	TS	Statis tic
Open Culture		7 (1.4)	11 (2.2)	22 (4.4)	144 (29.0)	206 (41.5)	106 (21.4)	2337	4.929
Machine Learning Algorithms		5 (1.0)	5 (1.0)	47 (9.5)	205 (41.3)	79 (15.9)	155 (31.3)	2301	4.904
Expert System		7 (1.4)	14 (2.8)	60 (12.1)	163 (32.9)	212 (42.7)	40 (8.1)	2167	4.592
Natural Language Processing		0 (0.0)	10 (2.0)	153 (30.8)	126 (25.4)	138 (27.8)	69 (13.9)	2087	4.488
Digital Learning Platform		5 (1.0)	5 (1.0)	157 (31.7)	122 (24.6)	146 (29.4)	61 (12.3)	2070	4.462
Automated grading		6 (1.2)	8 (1.6)	173 (34.9)	146 (29.4)	89 (17.9)	74 (14.9)	2014	4.379
Audio Processing		2 (0.4)	143 (28.8)	90 (18.1)	80 (16.1)	121 (24.4)	60 (12.1)	1843	4.259

Where NA indicates Not at all, VSE – very small extent, SE – Small extent, ME – Moderate extent, LE – Large extent, VLE – Very large extent, TS – Total Score, and Std. dev – Standard deviation. Source: Researcher's Field Survey, 2024

From the result, it is shown that open culture has the highest weighted mean score showing the value of 4.929 with the standard deviation of 0.872 being rated "Large extent" by the mode (highest frequency and percentage distribution) of 206 (41.5 percent); followed by the second rated variable, known as machine learning algorithms having the value of 4.904wms with the standard deviation of 1.035 being rated "Moderate extent" by the mode value of 205 (41.3 percent); expert system (4.592wms; ± 0.864 std) being rated "Large extent" by 212 (42.7 percent); natural language processing (4.488wms; ± 1.070 std) being rated "Small extent" by 153 (30.8 percent); digital learning platform (4.462wms; ± 1.056 std) being rated "Small extent" by 157 (31.7 percent); automated grading (4.379wms; ± 1.130 std) being rated "Small extent" by 173 (34.9 percent), and the least weighted score of all the variable is audio processing having the value of 4.259 with the standard deviation of 1.349 being rated "Very small extent" by the frequency and percentage distribution of 143 (28.8 percent).

It can be deduced from the result that the open culture and expert system as a variable is known to a large extent as part of the variable which determines the disruptive technology

and institutional sustainability of professional accounting. Other variables such as machine learning algorithms are known as a determinate of disruptive technology and institutional sustainability of professional accounting to a moderate extent while natural language processing, digital learning platform, and automated grading are determined to a small extent, and audio processing is a factor used to determine the disruptive technology and institutional sustainability of professional accounting is known in a very small extent. Open culture is regarded as the most artificial intelligence factor which is reinventing the world of business today and has more advantages on the technology to embrace a culture of innovation.

4.1.11 Institutional Goals Actualization

The institutional goals actualization (IGA) is a variable used to measure the institutional sustainability of the professional accounting institutes in Nigeria. Six (6) factors were used to determine the IGA of an institutional goals actualization, the variables are student enrollment, participant retention, maintain professional program quality, produce world-class chartered accountants, ethical accounting standards, and technical accounting competence.

Table 13 Descriptive Analysis of Institutional Goals Actualization

Institutional Goals Actualization	Frequency and Percentage Distribution						Weighted Mean Score		
	VL (%)	L (%)	ML (%)	MH (%)	H (%)	VH (%)	TS	Statis tic	Std. dev
Student Enrollment	9 (1.8)	10 (2.0)	23 (4.6)	78 (15.7)	181 (36.5)	195 (39.3)	2485	5.251	0.880
Maintain professional program quality	10 (2.0)	11 (2.2)	25 (5.0)	80 (16.1)	188 (37.9)	182 (36.7)	2459	5.210	0.893
Technical accounting competence	10 (2.0)	12 (2.4)	18 (3.6)	169 (34.1)	95 (19.2)	192 (38.7)	2391	5.107	1.000
Ethical accounting standards	2 (0.4)	7 (1.4)	33 (6.7)	156 (31.5)	113 (22.8)	185 (37.3)	2414	5.099	0.969
Participant Retention	10 (2.0)	9 (1.8)	67 (13.5)	136 (27.4)	225 (45.4)	49 (9.9)	2192	4.660	0.883
To produce world-class chartered accountants	2 (0.4)	12 (2.4)	158 (31.9)	140 (28.2)	103 (20.8)	81 (16.3)	2061	4.465	1.124

Where VL indicates Very Low, L – low, ML – Moderately low, MH – Moderate high, H – High, VH – Very high, TS – Total Score, and Std. dev – Standard deviation.

Source: Researcher's Field Survey, 2024

Results in Table 13 revealed that the student enrollment factor is the most rated factor used to measure the actualization of the institutional goals of professional accounting institutes in Nigeria. The factor shows the weighted mean score of 5.251 with the standard deviation of 0.880 being rated "very high" by the mode value (highest frequency and percentage distribution) of 195 (39.3 percent); maintain professional program quality (5.210wms; ± 0.893 std) being rated "high" by 188 (37.9 percent); technical accounting competence (5.107wms; ± 1.000 std) being rated "very high" by 192 (38.7 percent); ethical accounting standards (5.099wms; ± 0.969 std) being rated "very high" by 185 (37.3 percent); participant retention (4.660wms; ± 0.883 std) being rated "high" by 225 (45.4 percent), and produce world-class chartered accountants (4.465wms; ± 1.124 std) being rated "moderate-low" by the mode value (highest frequency and percentage distribution of 158 (31.9 percent). This proves that the IGA of the IS is best measured using student enrollment. Though, the result has proven that student enrollment, ethical accounting standards, and technical accounting competence are very high factors of IGA while participant retention, maintain professional program quality are high factors of IGA, and producing world-class chartered accountants is a moderately low factor to determine the IGA of institutional sustainability of professional accountants in Nigeria.

4.2 Test of Hypothesis

H₀₁: artificial intelligence has no significant effect on institutional goals actualization of professional accounting institutes in Nigeria

The hypothesis was tested using an SEM and it was explained accordingly as presented in Figure 1 and Tables 14.

Figure 1: Disruption Accounting Technology and Institutional Goals Actualization

Table 14: Effect of Disruption Accounting Technology on Institutional Goals Actualization

	Coeff	Std. Error	Z	P > Z
Constant	0.746	0.055	13.51	0.000
AI	0.140	0.047	2.92	0.003
RT	-0.182	0.022	-8.23	0.000
QBT	0.113	0.315	3.61	0.000
CA	0.413	0.400	10.34	0.000
BCT	0.058	0.140	1.45	0.148
Chi2_bs(5)	152.950	P -value	0.000	R² = 0.569
Goodness of Fit				
AIC	-911.9392	BIC	-798.3619	Df = 27

Source: Researcher's Field Survey, 2021

Following the results of the structural equation modelling on disruptive technology and institutional goals actualization, the analysis of the coefficient value is revealed in Table 14 and Figure 1 showing ($\beta_1 = 0.140$; $\beta_2 = -0.182$; $\beta_3 = 0.413$; $\beta_4 = 0.113$); while four out of all the coefficients showed a positive contribution to the institutional goals actualization, only robotic technology had a negative contribution to the institutional goal actualization. The individual results further revealed that only four of the variables had a significant effect at p-value < 0.01 and 0.05 respectively. The coefficient and the p-value of the variable which are significant with IGA are given as: AI (coeff. = 0.140; $p = 0.003$) positive and significant; RT (coeff. = -0.182; $p = 0.000$) negative but significant; CA (coeff. = 0.413; $p = 0.000$) positive and

significant, and QBT (*coeff.* = 0.113; $p=0.000$) positive and significant, while BCT (*coeff.* = 0.148; $p=0.058$) was positive but insignificant at p -value < 0.01 and 0.05.

This means that AI, OBT, CA, and RT had significant effect on institutional goals actualization of professional accounting institutes in Nigeria. As these variables increase by one unit, the actualization of the institutional goals also increases statistically by 0.140, 0.413, and 0.113 respectively (that is an increase of 14%, 41.3%, and 11.3%). However, a unit increase in RT results statistically in a decrease in institutional goal actualization by -0.182 (-18.2%) of professional accounting institutes in Nigeria. The covariance between the disruptive technology and the actualization of the institutional goals is 0.033. The covariance measures the relationship between the two variables and the extent to which the variables change together. The result shows that a 3.3% increase in the disruptive technology will increase institutional goals actualization.

4.2.1 Decision: A decision rule is stated based on the hypothesis set in Chapter One. The decision rule states that if the probability value (p -value) is less than 0.05 (5% significance level), do not accept the null hypothesis, otherwise, accept the null hypothesis. The p -value of the analysis shows that the null hypothesis is not accepted at p -value < 0.05 and the alternative is used as the conclusion of the analysis. Therefore, the aggregated findings revealed that disruptive technology have a positive and significant effect on institutional goals actualization at p -value (0.000) < 0.05 (5% significance level) with the Chi2_bs(5) of 152.950

The goodness of fit of the model shows that the data has a good fit. Another test was conducted on the goodness of fit using AIC and BIC; the result shows that BIC best fits the model since it has the least value of -798.3617 compared to the value of AIC having -911.9392. This shows that BIC (Bayesian Information Criterion) best fits the model. Another goodness of fit considered is R square value of 0.569. The R square of 56.9% shows the composition of disruptive technology in institutional goals actualization while the remaining 43.1% constitutes factors not considered in this study.

The analysis in hypothesis through the aggregated results revealed that statistically, artificial intelligence has a positive significant effect on institutional goals actualization of professional accounting associations in Nigeria. Also, four (AI, QBT, CA, RT) out of the five individual variables showed a significant effect on institutional goals actualization. The findings in this study showed similarities and disparities with the conceptual, empirical and theoretical

positions of previous scholars. It is important to note that scholars in accounting institutions have interchangeably intellectualized disruptive technology as disruptive accounting technology (Casino et al., 2019; Cong et al., 2018; Lui, 2019; Siegel, 2020).

Conceptually, Okunbanjo (2020) and Kotlar et al. (2018) claimed that to comprehend organisational goals which comprise the goals that a business anticipates accomplishing in a set period of time both programmatically and organizationally given the importance of goal-setting for predicting organizational behaviors and outcomes, it is essential to develop a more detailed and comprehensive understanding of the factors affecting firms' decisions to pursue a specific set of goals. Thus, Siegel (2020) opined that to achieve sustainability of goals actualization of accounting professional institutions with the global trend, disruptive technology is paramount.

Ousama (2019) added that disruptive technology with regards to accounting is one that displaces an established accounting technology and shakes up the accounting practices to create a completely new accounting practice. Singh and Hanafi (2019) supported Ousama (2019) that disruptive technologies are identified after their effects are known and the benefit is seen with hindsight. In the opinion of Indiran and Muhammad (2018), disruptive technologies have to mature over a period of time to evolve from an innovation to a useable product. Likewise, Chishakwe and Smith (2012) stressed that technology per se is not disruptive, but it becomes disruptive when it exceeds the performance of technology that is currently in use. As such, in the opinion of Windel (2007), poor knowledge and adoption of disruptive accounting technology among professional accounting institutions in developing economies may adversely affect their international competition with professional accounting institution in developed economies.

Additionally, aligning this study's findings in previous scholarly empirical works, Chishakwe and Smith (2012) found that disruptive technology has a significant impact on the achievement of business goals in a developing nation. Similarly, a study by Kruskopf *et al.* (2019) found that there is a significant effect of disruptive technology on all aspects of companies' achievements. Dileep *et al.* (2019) findings supported other works that a significant and positive relationship existed between disruptive technology and the performance of firms in terms of the actualization of set objectives. More so, Lui (2019) and Naidoo and Hoque (2018) found disruptive information technology innovations positively and significantly impacted firm profitability and goals. Despite the overall aggregated results,

the individual coefficient results in the SEM analysis for hypothesis one revealed that, statistically, while disruptive technology such as artificial intelligence (AI), cloud accounting (CA), and quick book technology (QBT) have a positive and significant effect, robotic technology (RT) has a negative but significant effect on institutional goals actualization (IGA) of professional accounting associations in Nigeria. These results support previous works such as a study conducted by Seseni and Mbohwa (2018) that a positive relationship exists between artificial intelligence and goal actualization of professional accounting association. Also, Odoh *et al.* (2018) found the application of artificial intelligence to positively influence the performance of accounting functions. More so, Shahid and Li (2019) found that integration of AI in the marketing functions improved the performance of the business and thus, enhanced achievement of profitability and competitive advantage in line with previous works, Lichtenthaler (2019) established that an intelligence-based perspective underscores the need to integrate AI applications with specific human expertise to complicate imitation by competitors and to achieve business goals.

The researcher concluded that the study from Model 1 implies that disruptive technology has the potential to impact institutional goals actualization by creating new technology development for artificial intelligence, cloud accounting, and QuickBooks technology. Thus, in addition, it will affect the development of institutional goals actualization of professional accounting institutes in Nigeria. Therefore, based on the result obtained on robotic technology where robotic technology showed a negative but significant effect on IGA, the implication is that disruptive technology could affect actualization of the institutional goals negatively if not implemented with adequate knowledge and training. Nevertheless, robotic technology will slowly impact institutional goals actualization since this is the direction of modern technology for achieving and sustaining greater institutional goals actualization. Consequently, based on the combined SEM analysis results, disruptive technology dimensions have a positive significant effect on institutional goals actualization of professional accounting institutes in Nigeria.

CONCLUSION AND RECOMMENDATIONS

The Ministry of Finance should increase In Disruptive technology has changed every aspect of the business environment especially in accounting institute. Today, technologists take the lead role in innovation and idea generation which makes every organization highly productive and creative. This technology has the administration advantage of providing the necessary

infrastructure for accountants, institutes, and organizations across the chain to conduct an online transaction and develop an app without the typical use, delays, and cost of paying an accountant, as ubiquitously obtains at present. Disruptive technology leverages on many benefits of verifiable, transparent, visible, traceable, and secure data management capabilities, with positive externalities of guaranteed information documentation and security.

The study found a significant effect of artificial intelligence on institutional goal actualization of the professional accounting institutes in Nigeria. The study had demonstrated the reason why technology must be introduced and supported by the accountants and institutions. The study was, however, carried out among the accountant professionals as well as institutes such as ICAN, ACCA, and ANAN respectively. In addressing this, the data used in the study was primary data collected from both foreigners and Nigerians who are either a member of ICAN or ANAN professional body.

In line with the results and the findings obtained in each of the models, the following recommendations are made:

1. Management of institutions and organisations should adopt the use of technology, this should help them to be more productive and creative. More so, accounting technology must take a lead role in every school curriculum..
2. Professionals accountants should adopt the use of artificial intelligence and cloud accounting techniques with the ability to learn, recognizing patterns with logical reasoning that would make them do a better job of providing financial information to their clients.
